Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

  TITLE     Direct Submission
  JOURNAL   Submitted (20-NOV-2002) Human Genome Sequencing Center, Department
            of Molecular and Human Genetics, Baylor College of Medicine, One
            Baylor Plaza, Houston, TX 77030, USA
COMMENT     On Nov 20, 2002 this sequence version replaced gi:23811860.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
            (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
            in the feature table below represents a scaffold in the Atlas
            assembly (a 'contig-scaffold'). Within each contig-scaffold,
            individual sequence contigs are ordered and oriented, and separated
            by sized gaps filled with Ns to the estimated size. The sequence
            may extend beyond the ends of the clone and there may be sequence
            contigs within a contig-scaffold that consist entirely of whole
            genome shotgun sequence reads. Both end sequences and whole genome
            shotgun sequence only contigs will be indicated in the feature
            table.
            -------------- Genome Center

  TITLE     Direct Submission
  JOURNAL   Submitted (09-NOV-2002) Human Genome Sequencing Center, Department
            of Molecular and Human Genetics, Baylor College of Medicine, One
            Baylor Plaza, Houston, TX 77030, USA
COMMENT     On Nov 6, 2002 this sequence version replaced gi:23101322.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
            (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
            in the feature table below represents a scaffold in the Atlas
            assembly (a 'contig-scaffold'). Within each contig-scaffold,
            individual sequence contigs are ordered and oriented, and separated
            by sized gaps filled with Ns to the estimated size. The sequence
            may extend beyond the ends of the clone and there may be sequence
            contigs within a contig-scaffold that consist entirely of whole
            genome shotgun sequence reads. Both end sequences and whole genome
            shotgun sequence only contigs will be indicated in the feature
            table.
            -------------- Genome Center
                Center: Baylor College of Medicine
                Center code: BCM
                Web site: http://www.hgsc.bcm.tmc.edu/
                Contact: hgsc-help@bcm.tmc.edu
            -------------- Project Information
                Center project name: GOVD
                Center clone name: CH230-177H19
            -------------- Summary Statistics
                Assembly program: Phrap; version 0.990329
                Consensus quality: 203179 bases at least Q40
                Consensus quality: 206343 bases at least Q30
                Consensus quality: 208281 bases at least Q20
                Estimated insert size: 208801; sum-of-contigs estimation
                Quality coverage: 6x in Q20 bases; sum-of-contigs estimation
            --------------
            * NOTE: Estimated insert size may differ from sequence length
            *   (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 1 contigs. Gaps between the contigs
            * are represented as runs of N. The order of the pieces
            * is believed to be correct as given, however the sizes
            * of the gaps between them are based on estimates that have
            * provided by the submittor.
            * This sequence will be replaced
            * by the finished sequence as soon as it is available and
            * the accession number will be preserved.
            *       1   263127: contig of 263127 bp in length.

XX
CC The invention relates to a novel nuclear receptor polypeptide, designated
CC SXR (steroid and xenobiotic receptor). SXR (i) forms a heterodimer with
CC retinoid X receptor (RXR), (ii) binds to a direct or inverted repeat
CC response element motif based on the half-site AGTTCA, (iii) activates

```
CC   transcription through response elements present in steroid-inducible P450
CC   genes, in response to a wide variety of natural and synthetic steroid
CC   hormones and (iv) is prominently expressed in liver and intestine. SXR
CC   regulates expression of catabolic enzymes, in response to many different
CC   steroids, and thus affects metabolism. SXR is a broad specificity, low-
CC   affinity receptor for reducing excessive levels of steroids in the
CC   circulation (see AAX89090 for detailed uses of SXR polypeptide).
CC   Sequences AAX89081-89 represent fragments from various steroid and
CC   xenobiotic inducible P450 enzymes containing putative SXR response
CC   elements

XX
PS   Disclosure; Page 23; 64pp; English.
XX
CC   The present sequence represents a putative response element for a steroid
CC   -activated nuclear receptor, termed steroid and xenobiotic receptor
CC   (SXR). The response element is identified in steroid hydroxylase CYP3A1.
CC   The SXR polypeptide is capable of forming a heterodimer with retinoid X
CC   receptor (RXR), activating transcription through response elements found
CC   in steroid inducible P450 genes in response to a variety of natural and
CC   synthetic steroid hormones and prominently expressed in liver and
CC   intestine. SXR binds to a direct or inverted repeat response element
CC   motif based on the half site AGTTCA. SXR is useful for identifying
CC   compounds which are agonists or which activate the receptor. The
CC   compounds identified are useful for treating a wide variety of conditions
CC   such as Cushing's syndrome, virulism and hirsutism, androgen excess due
CC   to polycystic ovarian syndrome and enzymatic defects which leads to
CC   accumulation of steroids, resulting in hypertension and aberrant
CC   development of secondary sexual characteristics in both sexes. Transgenic
CC   animals which express human SXR serve as models for human response to
CC   various agents which potentially impact P450-dependent metabolic
CC   processes

PT   Modulating the metabolism of steroids and xenobiotics with a UGT
PT   modulator, useful for modifying the physiological response to and/or
PT   efficient detoxification of harmful steroids and/or xenobiotic compounds.
XX
PS   Disclosure; Page 26; 51pp; English.
XX
CC   The present sequence is a direct repeat-3 (DR-3) response element for the
CC   steroid xenobiotic receptor (SXR/PXR) identified in the rat cytochrome
CC   P450-3A1 gene. A database search showed that putative SXR response
CC   elements are found in genes encoding steroid hydroxylases, P450
CC   oxidoreductase, and glucuronosyl transferase. SXR is a broad specificity,
CC   low affinity, steroid-activated receptor. The present invention relates
CC   to modulation of metabolism of steroids and xenobiotics. Nuclear
CC   receptors including SXR and constitutively active receptor (CAR) are
CC   characterised as xenosensors regulating expression of P450 genes. The
CC   ability of this group of receptors to regulate expression of UDP-
CC   glucuronosyl transferase (UGT) in response to steroids and/or xenobiotics
CC   provides novel approaches for direct regulation/activation of a
```

CC glucuronidation pathway, thereby providing methods to achieve physiologic
CC homeostasis with respect to steroids and/or xenobiotics. SXR and CAR
CC regulation of UGT represents the first evidence of receptors that can
CC transduce/transactivate both Phase I and Phase II adaptive hepatic
CC response. A claimed method for modulating the metabolism or clearance of
CC steroid and/or xenobiotic compounds involves administering a modulator of
CC UGT. The modulator can be a nucleic acid, protein and/or chemical
CC compound which binds a UGT direct repeat or inverted repeat response
CC element, or which activates UGT glucuronidation of steroids or
CC xenobiotics. A claimed method for inducing expression of steroid
CC hydroxylase comprises activating SXR/PXR and/or CAR

CC The invention describes a new receptor polypeptide (I) or its functional
CC fragments. The method comprises forming a heterodimer with retinoid X
CC receptor (RXR), binding to a direct or inverted repeat response element
CC motif based on the half site AGTTCA, activating transcription through
CC response elements found in steroid inducible P450 genes in response to a
CC wide variety of natural and synthetic steroid hormones, and being
CC prominently expressed in the liver and the intestine. The methods and
CC compositions of the present invention are useful for identifying a
CC variety of therapeutically useful compounds used in the treatment of a
CC wide variety of indications, such as Cushing's syndrome which leads to
CC obesity, fatigue, hypertension, oedema and osteoporosis, virilism and
CC hirsutism in females due to overproduction of testosterone, androgen
CC excess due to polycystic ovarian syndrome, enzymatic defects which lead
CC to accumulation of specific steroids, and ameliorate the effect of
CC substances in the diet and/or environment which act as endocrine
CC disruptors. This sequence represents steroid hydroxylase rCY3A1 putative
CC SXR (steroid X receptor) response element

PT New steroid and xenobiotic receptor polypeptides, useful in mediating the
PT physiological effects of steroids and xenobiotics, particularly when
PT combinations of the compounds disrupt homeostatis or cause drug
PT interaction.
XX
PS Disclosure; Fig 6A; 41pp; English.
XX
CC The invention relates to a receptor polypeptide or its functional
CC fragment. The polypeptide forms a heterodimer with retinoid X receptor,
CC binds to a direct or inverted repeat response element motif based on the
CC half site AGTTCA, activates transcription through response elements found
CC in steroid inducible P450 genes in response to a wide variety of natural
CC and synthetic steroid hormones and is prominently expressed in the liver
CC and the intestine. The receptor polypeptides are useful in mediating the
CC physiological effects of steroids and xenobiotics, particularly when
CC combinations of the compounds disrupt homeostatis or cause drug
CC interaction. The receptor polypeptides are also useful in monitoring
CC total steroid levels and inducing the expression of genes encoding
CC xenobiotic metabolising enzymes. The steroid and/or xenobiotic compounds

```
CC   are useful for treating a disease state e.g. Cushing's syndrome, virilism
CC   and hirsutism in females, polycystic ovarian syndrome, 21-hydroxylase
CC   deficiency, 11beta-hydroxylase deficiency, 3beta- hydroxysteroid
CC   dehydrogenase deficiency, 17-hydroxylase deficiency, or breast,
CC   colorectal or prostate cancers. The methods are useful for preventing
CC   steroid toxicity in a subject undergoing treatment of a disease state, or
CC   for slowing clearance of a therapeutic steroid or xenobiotic from a
CC   subject. The present sequence represents a rat steroid and xenobiotic
CC   receptor SXR response element

PT   Predicting toxicity of compounds, useful in development of safe drugs, by
PT   measuring the differential expression of specific genes in cells exposed
PT   to test compounds.
XX
PS   Claim 2; SEQ ID NO 592; 895pp; English.
XX
CC   The invention relates to methods of predicting at least one toxic effect
CC   (or toxicity progression or the mechanism of toxicity) of a compound. The
CC   methods involve detecting the level of expression of at least one of a
CC   set of 680 genes ADW21622-ADW22301 or at least one of a set of 17 genes
CC   (including ADW22362, ADW22414 and ADW22481-ADW22483) in a tissue or cell
CC   exposed to the compound, and determining whether the gene is
CC   differentially expressed compared with a control tissue or cell.
CC   Differential expression of the gene in the presence of the compound is
CC   indicative of a toxic effect, of toxicity progression or of a specific
CC   mechanism of toxicity. The toxic effect is especially hepatotoxicity,
CC   particularly hepatitis, liver necrosis, protein adduct formation or fatty
CC   liver. The invention also relates to sets of primers and probes specific
CC   for at least two genes selected from ADW21622-ADW22301; solid supports
CC   (e.g., DNA chips) and kits containing the probes; and a database
CC   containing DNA sequence information and expression information for at
CC   least two of the 680 genes from hepatotoxin-exposed tissues. The
CC   invention is based on the determination of global changes in gene
CC   expression in tissues or cells exposed to known toxins, particularly
CC   hepatotoxins, and the identification of individual genes (toxicity
CC   markers) that are differentially expressed on toxin exposure. The changes
CC   in gene expression can be characteristic of different mechanisms of
CC   hepatotoxicity mediated by various classes of compounds. Such compounds
CC   include: direct acting compounds which cause damage to macromolecules,
CC   especially proteins and lipids by directly interacting with them;
CC   steatotic compounds which cause an accumulation of fat in the liver; and
CC   cholestatic compounds which impair bile flow or bile acid transport,
CC   resulting in jaundice. The methods of the invention are useful in
CC   toxicology screening for predicting the toxic effects (especially
CC   hepatotoxic effects) of compounds for the development of safer drugs.
CC   Sequences ADW21622-ADW22301 represent specifically claimed hepatotoxicity
CC   marker genes of rat origin whose expression is altered on exposure to
```

```
CC   hepatotoxins.

PT   Compound that induces cytochrome P-450 monooxygenase 3A4 gene expression
PT   for treating cholestatic liver disease comprising administering compound
PT   identified by determining binding of test compound to human pregnane X
PT   receptor.
XX
PS   Example 1; Page 22; 63pp; English.
XX
CC   The present sequence is that of the rat cytochrome P450 monooxygenase 3A1
CC   gene (CYP3A1) DR3 pregnane X receptor response element (PXRE). 4 Copies
CC   of this sequence were inserted into the BamHI site of pBLCAT2 to create
CC   reporter plasmid (DR3)4-tk-CAT. This was used in CV1 transfection assays
CC   to demonstrate that novel human pregnane X receptor (hPXR, see AAM50624)
CC   is a functional nuclear receptor that is activated by dexamethasone-t-
CC   butylacetate, a known mPXR1 ligand. The oligonucleotide was also used in
CC   band shift assays, which showed that hPXR binds efficiently to the CYP3A4
CC   IR6 PXRE as a heterodimer with the 6-cis retinoic acid receptor, and that
CC   hPXR and mPXR1 have very similar DNA binding profiles. The invention
CC   provides nucleic acids encoding hPXR, expression vectors, host cells, and
CC   methods of using the receptor-encoding sequences to screen for compounds
CC   capable of modulating CYP (e.g. CYP3A4) gene expression. Such compounds
CC   are useful for treating cholestatic liver disease (claimed), such as
CC   primary biliary cirrhosis, primary sclerosing cholangitis, autoimmune
CC   hepatitis with cholestatic features, autoimmune cholangitis, cholestasis
CC   of pregnancy, paediatric cholestatic syndromes, and drug-induced
CC   cholestasis

PT New nucleic acid containing a transcriptional enhancer of cytochrome P450
PT CYP3A4, used to identify xenobiotics that induce cytochrome expression.
XX
PS Disclosure; Page 11; 38pp; English.
XX
CC The invention relates to an isolated nucleic acid (I) containing a
CC transcriptional enhancer of the production or expression of cytochrome
CC P450 CYP3A4. (I), or its fragments, are useful in genetic analysis,
CC particularly for: detecting allelic variants of (I), for predicting drug
CC metabolism and susceptibility to disease (particularly prostatic cancer),
CC and for analysis of the effect of allelic variations on CYP3A4
CC transcription and expression. Assay systems that include (I) linked to a
CC reporter sequence are used to screen xenobiotics (therapeutic drugs) for
CC ability to induce CYP3A4 expression in cells or animals. Candidate drugs
CC that induce CYP3A4 will: (a) have reduced in vivo lifetime, since they
CC will be metabolized by CYP3A4, or (b) may increase metabolism and/or
CC elimination of co-administered drugs. Such compounds should be discarded
CC in favor of non-inducing candidates. Also, induction of CYP3A4 can be
CC used to accelerate metabolism of xenobiotic toxins or endogenous CYP3A4
CC substrates, while inhibition of CYP3A4 can be used to overcome
CC interactions with drugs. (I) is also potentially useful as a genetic
CC switch, e.g. for activating a transgene in the liver. Identification of
CC structural motifs associated with CYP3A4 induction may be used for
CC rational drug design. The present sequence represents a nuclear receptor
CC response element in the proximal 5' flanking region of the rat CYP3A23

CC   The invention relates to a novel nuclear receptor polypeptide, designated
CC   SXR (steroid and xenobiotic receptor). SXR (i) forms a heterodimer with
CC   retinoid X receptor (RXR), (ii) binds to a direct or inverted repeat
CC   response element motif based on the half-site AGTTCA, (iii) activates
CC   transcription through response elements present in steroid-inducible P450
CC   genes, in response to a wide variety of natural and synthetic steroid
CC   hormones and (iv) is prominently expressed in liver and intestine. SXR
CC   regulates expression of catabolic enzymes, in response to many different
CC   steroids, and thus affects metabolism. SXR is a broad specificity, low-
CC   affinity receptor for reducing excessive levels of steroids in the
CC   circulation (see AAX89090 for detailed uses of SXR polypeptide).
CC   Sequences AAX89081-89 represent fragments from various steroid and
CC   xenobiotic inducible P450 enzymes containing putative SXR response
CC   elements

CC   -activated nuclear receptor, termed steroid and xenobiotic receptor
CC   (SXR). The response element is identified in steroid hydroxylase CYP3A2.
CC   The SXR polypeptide is capable of forming a heterodimer with retinoid X
CC   receptor (RXR), activating transcription through response elements found
CC   in steroid inducible P450 genes in response to a variety of natural and
CC   synthetic steroid hormones and prominently expressed in liver and
CC   intestine. SXR binds to a direct or inverted repeat response element
CC   motif based on the half site AGTTCA. SXR is useful for identifying
CC   compounds which are agonists or which activate the receptor. The
CC   compounds identified are useful for treating a wide variety of conditions
CC   such as Cushing's syndrome, virulism and hirsutism, androgen excess due
CC   to polycystic ovarian syndrome and enzymatic defects which leads to
CC   accumulation of steroids, resulting in hypertension and aberrant
CC   development of secondary sexual characteristics in both sexes. Transgenic
CC   animals which express human SXR serve as models for human response to
CC   various agents which potentially impact P450-dependent metabolic
CC   processes

XX
CC   The present sequence is a direct repeat-3 (DR-3) response element for the
CC   steroid xenobiotic receptor (SXR/PXR) identified in the rat cytochrome
CC   P450-3A2 gene. A database search showed that putative SXR response
```

CC elements are found in genes encoding steroid hydroxylases, P450
CC oxidoreductase, and glucuronosyl transferase. SXR is a broad specificity,
CC low affinity, steroid-activated receptor. The present invention relates
CC to modulation of metabolism of steroids and xenobiotics. Nuclear
CC receptors including SXR and constitutively active receptor (CAR) are
CC characterised as xenosensors regulating expression of P450 genes. The
CC ability of this group of receptors to regulate expression of UDP-
CC glucuronosyl transferase (UGT) in response to steroids and/or xenobiotics
CC provides novel approaches for direct regulation/activation of a
CC glucuronidation pathway, thereby providing methods to achieve physiologic
CC homeostasis with respect to steroids and/or xenobiotics. SXR and CAR
CC regulation of UGT represents the first evidence of receptors that can
CC transduce/transactivate both Phase I and Phase II adaptive hepatic
CC response. A claimed method for modulating the metabolism or clearance of
CC steroid and/or xenobiotic compounds involves administering a modulator of
CC UGT. The modulator can be a nucleic acid, protein and/or chemical
CC compound which binds a UGT direct repeat or inverted repeat response
CC element, or which activates UGT glucuronidation of steroids or
CC xenobiotics. A claimed method for inducing expression of steroid
CC hydroxylase comprises activating SXR/PXR and/or CAR

CC The invention describes a new receptor polypeptide (I) or its functional
CC fragments. The method comprises forming a heterodimer with retinoid X
CC receptor (RXR), binding to a direct or inverted repeat response element
CC motif based on the half site AGTTCA, activating transcription through
CC response elements found in steroid inducible P450 genes in response to a
CC wide variety of natural and synthetic steroid hormones, and being
CC prominently expressed in the liver and the intestine. The methods and
CC compositions of the present invention are useful for identifying a
CC variety of therapeutically useful compounds used in the treatment of a
CC wide variety of indications, such as Cushing's syndrome which leads to
CC obesity, fatigue, hypertension, oedema and osteoporosis, virilism and
CC hirsutism in females due to overproduction of testosterone, androgen
CC excess due to polycystic ovarian syndrome, enzymatic defects which lead
CC to accumulation of specific steroids, and ameliorate the effect of
CC substances in the diet and/or environment which act as endocrine
CC disruptors. This sequence represents steroid hydroxylase rCY3A2 putative
CC SXR (steroid X receptor) response element

            Naming Conventions: EST name is generated by the concatenation of
            the JGI Clone Id and the direction of sequencing. The suffix '.fwd'
            indicates a forward sequencing read of the insert. It does not
            necessarily reflect the orientation of the insert.
